

Qaarib

Backend Orchestration Architecture

A Qatar-local agentic assistant on the Fanar platform · Fanar Hackathon 2026

An Agent That Reasons About Tools — and Knows When To Act

Qaarib is a true *agentic* system: Fanar performs live intent classification, selects and sequences tools, plans multi-step actions, and carries context across turns. Around that reasoning core we built a deterministic Qatar execution layer, so the agent's decisions are grounded in a real metro graph, live places, and calendar actions — not guesses.

Agentic intelligence for open-ended intent; deterministic reliability for what must never fail. The agent is smart enough to know which it needs.

Agentic where it matters, deterministic where it must be: Fanar reasons about intent and orchestrates tools for open-ended requests, while a grounded execution layer guarantees that core Qatar tasks stay instant and correct even if the model is slow or unreachable.
