

Qaarib

Backend Orchestration Architecture

A Qatar-local agentic assistant on the Fanar platform · Fanar Hackathon 2026

The Unique Selling Point — Deterministic-First, Model-Last

Most assistants route *every* request through the LLM, so latency and hallucination are on the critical path of *everything*. Qaarib inverts this: four deterministic layers try to answer first. The Fanar model is a *last resort*, reached only when nothing local can answer.

Greetings, current time, calendar creation, and routes between known Qatar locations never touch the model at all.

Reliability by design: each deterministic layer returns immediately on a hit, so model latency and hallucination are removed from the critical path of the most common Qatar-local tasks. If Fanar is slow or unreachable, the deterministic zone still answers.
